A Study on Creation and Application of Electronic Chinese Buddhist Texts: With Yogācārabhūmi as a Case Study

*Huimin Bhikkhu, Christian Wittern, Aming Tu, Lijuan Guo, Ray Chou
*Professor, National Institute of the Arts, Taiwan

Summary

This research is an attempt to create and markup electronic data. We try to use tag sets of TEI and markup the documents (including contextual features such as <monogr>, <series>, <analytic>; structural features such as <div>, and nonstructural features such as <item>) based on the various translations and outlines of Yogācārabhūmi.

Second, the project described above will be cross-referenced with structural features of the electronic data, providing, for example <linkGrp><link targets="A1 B1 C1"/> <link targets="A2 B2 C2"/> <linkGrp/> , <link tagsets="n1579DD065 n1581DB002 n1582DB001"/> ). Interfaces will be developed, such as using the xml2dir.bat program on Sutra XML with IE5 xml parser, and DHTML and Javascript to provide menu. The Link will provide cross references through html.bat. This will be useful for comparing different translations and outlines.

Key words: Electronic Chinese Buddhist Texts, Yogācārabhūmi, SGML, XML, TEI
I. Background and Objectives of this Research

Buddhist texts feature a tremendous amount of valuable cultural treasure shared by all human beings. However, the enormous corpus of Buddhist texts as well as their secondary sources usually overwhelms interested researchers, students, or even teachers. Hence, it shall be a significant contribution to Buddhism Studies and an innovative move in the field of human science to employ the digital and electronic media and tools of contemporary information technology, and to utilize the characteristics of multivalent texts as well as standardized markup language (such as SGML, HTML, XML) in the management of vast Buddhist information so as to facilitate more efficient teaching, researching and information service.

The autobiography of Xuanzang(602-664) indicated that one of his goals to study in India was to learn and translate Yogācārabhūmi(YBh). Yogācārabhūmi records different levels of practice and achievements of a yogi (a practitioner or a Meditation practitioner). Encompassing the psychological, philosophical, and religious dimensions of the rich experiences of explorers who pursue the subtle spiritual life of enlightenment, Yogācārabhūmi can also serve as an encyclopedia for Mahayana Buddhism. Hence, this research shall focus on Yogācārabhūmi and aim to achieve the following goals.
1. Take Yogācārabhūmi, its outline books, and various translations as an example and explore the problems and solutions in processing electronic Buddhist texts, the treatment of rare characters, proofreading, and the creation of markups, full text search and web system.
2. Explore possibilities for the application of the digitalized data obtained via the previous process in the development of user interface, research methodology and teaching activities.

II. Achievements of the Research and Discussions

1. Provide an actual sample case for the development of electronic Chinese Buddhist Texts

After one year of experiment and practice, with Yogācārabhūmi, its various translations and outline books as an example in exploring the possibilities to benefit from the characteristics of electronic texts, a three-step process to create and markup the texts proves to be feasible and effective. It can be described as follows,

(1) Create and markup the contextual features of the document:

Take the compilation of the bibliography of Yogācārabhūmi for example. Its various references can be marked up as <monogr> (single volume books), <series> (books in series), <analytic> (periodical papers) with TEI tag sets. And meanwhile,
these marked-up references can also be linked to annotations, the full text of *Yogācārabhūmi* and other reference books.

(2) Create and markup the structural features of the documents:
Treat the various translations of *Yogācārabhūmi* and the content of their outline books as ordered hierarchy instead of linear texts and thus structure the original chapters into 20 divisions, then mark them with `<div>` and check them with HTMLHelp functions.

(3) Create and markup the non-structural features of the documents:
Use the dictionary entries in *Yogacam Dictionary* as an index for searching proper nouns, keywords in *Yogācārabhūmi* and mark these entries with `<item>`.

2. Sample Application of Chinese Buddhist Texts: Comparing Various Translations and Contrasting the Outline Book
The digitalized and marked-up electronic texts thus created can be applied to the comparison and contrast among various translations and the outline book. This can be done in three steps.

(1) Create cross-reference markups among related texts according to their structural features:
*Yogācārabhūmi* (n1579), various translations (n1581-4), the outline book (n1602) are marked up as div1=DA, div2=DB, div3=DC, div4=DD, …etc.). And add linking id, for instance, div1=n1579DA, div2=n1579DB, etc. The numbering can be done with a program that can add series numbers. Next, to add links markup. (See TEI, 14.4.3:A Three-way Alignment, pp. 433):

```
<linkGrp><link targets="A1 B1 C1"/>
<link targets="A2 B2 C2"/></linkGrp>
```
Related various translations and the outline book can be linked according to their ids. (e.g.: `<link tagsets="n1579DD065 n1581DB002 n1582DB001"/>`)

(2) Developing a User Interface
Display the XML file of the sutra with xml2dir.bat and use IE5 xml parser, DHTML as well as Javascript to display the table of content. Display the contrast among various translated versions with html.bat Link function, as illustrated in the following:
(3) Put the electronic files on the Internet
   Convert the marked-up electronic files into web files and put them on line for public use.
The marked up electronic texts can be used for comparing and contrasting various translations and the outline book.

III. Self-evaluation of the Research Project
So far, the contextual, structural and non-structural features of various translations
and outline books have been created and marked-up. Besides, the comparison and contrast among various translations and the outline book can be more efficiently achieved with the cross-reference markup functions developed in this project. And a user interface has also been developed to facilitate the publication of the marked-up texts on line for public use and scholars’ researches. Although the full-text search function has also been completed, the functions of inquiry via item search cannot be provided yet and are to be developed further.
